Phytochemical Screening and Antioxidant Activity of Ethanol Extract of *Psoralea corylifolia* seeds

Nelofar Gulam Nabi*, Mukta Shrivastava

Govt. Maharani Laxmi Bai Girls’ P.G. (Autonomous) College, Bhopal (M.P)-462002, India

1 Introduction

*Psoralea corylifolia* L. commonly known as ‘Babachi’. Belongs to family Fabaceae (Leguminosae). Its other common names are Malay Tea, Cot Chu, Ku Tzu Malaysia, Scurphea, Malaysian Scurphea, Po Ku Chih, Pha Cot Chi. It is an erect annual herb, 30-180 cm. high, found almost throughout India. *Psoralea corylifolia* grows as winter season weed. Leaves are broadly elliptic, arranged in racemes. incisodentate, flower yellow or bluish purple and seeds are smooth, adhering to the pericarp, dark brown and elongated\(^1\) in dense axillary, long peduneled heads, pods are small 3.5-4.5 mm x 2.0-3.0 mm, ovoid- oblong, somewhat compressed, mucronate, dark chocolate to almost black. The plant is harvested for the drug industry when it sets into flowering in Nov-March. Seed setting commences around April -May and seed germinate after shading. The major active constituents of *Psoralea corylifolia* are corylifols a-c (prenyloavanoids) that are present in the seeds\(^2\). Other active compound such as psoralen, isopsoralen and neobavaisflavones are found in the dried ripe fruits\(^3\) Daidzein (4:7 dihydroxuisoflavon) and genistein (4’5’7 trihydroxyisoflavon) are present in natural plants of *Psoralea corylifolia* as well as in-vitro cultures\(^4\). Other active constituents have since been identified, including neoba-vaisilfoavone, borachin, Bavaistfavooz, bavachalcone, bavachromene psoralidin, coryllifolinin, barachini psoralenoside, isopsoralenoside and coumarins\(^5\)., have been isolated from this plant. A number of chemical constituents, including flavonoids and coumarins, have been isolated from this plant. Since a number of prenyllflavonoids and related compounds were isolated from *Psoralea corylifolia*\(^6\). The plant species is expected to be a resource of lead compounds for new anti-MRSA drugs. Previous studies reported the presence of several new and known compounds like, furanocoumarins\(^5\), prenyl flavonoids\(^2\), aromatic terpenoids and chromenes\(^5\). Several chemical compounds were identified and documented from the *Psoralea corylifolia* including flavonoids (bavachalcone, bavachnin, bavachin, corlyin, and 6-prenynaringenin etc), coumarins (psoralidin, psoralen, isopsoralen and angelicin) and meroterpenes (bakuchiol and 3-hydroxybakuchiol)\(^5\).
Almost the plant is used by the Indian traditional system of medicine for the treatment of various skin diseases in human beings. In particularly, the seed of *Psoralea corylifolia* has significant medicinal properties. The seeds are used in indigenous medicine as laxative, aphrodisiac, anthelmintic, diuretic and diaphoretic in febrile conditions. The seeds have been specially recommended in the treatment for leucoderma, leprosy, psoriasis and inflammatory diseases of the skin[1]. The seed extracts inhibit the growth of *Staphylococcus citreus*, *S. aureus* and *S. albus* including strains resistant to penicillin's. The seeds possess anthelmintic activity against earth worms, psoralen being the active principle. The essential oil shows a selective activity against the skin *Streptococcu* and used in the treatment of skin affections. The seeds are used locally in the preparation of certain types of medicated oils and incense preparations. The root is useful in the caries of teeth[11]. The one-seeded fruits are highly regarded as an aphrodisiac and tonic to the genital organs. The seed is anthelmintic, antibacterial, aphrodisiac, astringent, cardiac, cytotoxic, deobstruent, diaphoretic, diuretic, stimulant, stomachic and tonic. It is used in the treatment of febrile diseases, premature ejaculation, impotence, lower back pains, frequent urination, incontinence, bed wetting etc. The seed extracts have been reported to have antiplatelet[12], antitumor, immunomodulatory properties[13] *in vitro* antimicrobial[14] and antioxidant activities[15] have also been reported. The isoflavones daidzein and genistein have been reported to reduce the chances of breast and colon cancer[16]. The seeds are used locally in the preparation of certain types of medicated oils and incense. The plant yields a useful medicinal oleoresin, coumarins, flavonoids, and meroterpenes such as psoralen, isopsoralen, neobavaisfoavone, bavachin, bavaisfoavone, bavachromene, psoralidin, corylifolinin, bavachinin, bavachalcone[17]. Therefore, the study was planned phytochemical screening and antioxidant activity of ethanol extract of *Psoralea corylifolia* seeds.

2 Materials and Methods

2.1 Plant collection

The mature seeds of *Psoralea corylifolia* were collected from the MPCST Bhopal (M.P.) India during month of January-February2016. Collected material were shade dried in an open air and grinded into powder for further use.

2.2 Preparation of the crude extracts

The powder of the *Psoralea corylifolia* seeds, were packed in the Soxhlet apparatus and extracted with ethanol, until the completion of extraction. The extract was filtered while hot and the resultant extract was distilled in vacuum under reduced pressure in order to remove the solvent completely, and later dried in a desiccator. After that ethanol extract of seeds was kept in air tight container for further study.

2.3 Preliminary Phytochemical analysis

The extracts were analyzed by the following procedures. To test for the presence of the alkaloids, saponins, tannins, terpenoids, flavonoids, glycosides, volatile oils and reducing sugars.

2.3.1 Test for alkaloids

(a) Dragendorff’s test: To 1 ml of the extract, add 1 ml of Dragendorff’s reagent (Potassium Bismuth iodide solution). An orange-red precipitate indicates the presence of alkaloids.

(b) Mayer’s test: To 1 ml of the extract, add 1 ml of Mayer’s reagent (Potassium mercuric iodide solution). Whitish yellow or cream coloured precipitate indicates the presence of alkaloids.

(c) Hager’s test: To 1 ml of the extract, add 3ml of Hager’s reagent (Saturated aqueous solution of picric acid), yellow coloured precipitate indicates the presence of alkaloids.

(d) Wagner’s test: To 1 ml of the extract, add 2 ml of Wagner’s reagent (Iodine in Potassium iodide). Formation of reddish brown precipitate indicates the presence of alkaloids.

2.3.2 Test for saponins

Take small quantity of alcoholic and aqueous extract separately and add 20 ml of distilled water and shake in a graduated cylinder for 15 minutes lengthwise. A 1cm layer of foam indicates the presence of saponins.

2.3.3 Test for Glycosides

(a) Legal test: Dissolve the extract in pyridine and add sodium nitroprusside solution to make it alkaline. The formation of pink red to red colour shows the presence of glycosides.

(b) Bajet test: To 1ml of the test extract, add 1ml of sodium picrate solution and the yellow to orange colour reveals the presence of glycosides.

(c) Keller-Killian test: 1gm of powdered drug is extracted with 10ml of 70% alcohol for 2 minutes, filtered, add to the filtrate, 10ml of water and 0.5ml of strong solution of lead acetate and filtered and the filtrate is shaken with5ml of chloroform. The chloroform layer is separated in a porcelain dish and removes the solvent by gentle evaporation. Dissolve the cooled residue in 3ml of glacial acetic acid containing 2 drops of 5% ferric chloride solution. Carefully transfer this solution to the surface of 2ml of concentrated sulphuric acid. A reddish brown layer forms at the junction of the two liquids and the upper layer slowly becomes bluish green, darkening with standing.

(d) Borntrager’s test: Add a few ml of dilute Sulphuric acid to1ml of the extract solution. Boil, filter and extract the filtrate with chloroform. The chloroform layer was treated with 1ml of ammonia. The formation of red colour of the ammonical layer shows the presence of anthraquinones glycosides.

2.3.4 Test for carbohydrates and sugars

UK J Pharm & Biosci, 2017: 5(2); 2
(a) Molisch’s test: To 2 ml of the extract, add 1 ml of α-naphthol solution, add concentrated sulphuric acid through the side of the test tube. Purple or reddish violet colour at the junction of the two liquids reveals the presence of Carbohydrates.

(b) Fehling’s test: To 1 ml of the extract, add equal quantities of Fehling solution A and B, upon heating formation of a brick red precipitate indicates the presence of sugars.

(c) Benedict’s test: To 5 ml of Benedict’s reagent, add 1 ml of extract solution and boil for 2 minutes and cool. Formation of red precipitate shows the presence of sugars.

2.3.5 Test for tannins and phenolic compounds

(a) Take the little quantity of test solution and mixed with basic lead acetate solution. Formation of white precipitates indicates the presence of tannins.

(b) To 1 ml of the extract, add ferric chloride solution, formation of a dark blue or greenish black colour product shows the presence of tannins.

(c) The little quantity of test extract is treated with Potassium ferric cyanide and ammonia solution. A deep red colour indicates the presence of tannins.

2.3.6 Test for flavonoids

(a) The drug in alcoholic and aqueous solution with few ml of ammonia is seen in U.V. and visible light, formation of fluorescence indicates the presence of flavonoids.

(b) Little quantity of extract is treated with amyl alcohol, sodium acetate and ferric chloride. A yellow colour solution formed, disappears on addition of an acid indicates the presence of flavonoids.

(c) Shinoda’s test: The alcoholic extract of powder treated with magnesium foil and concentrated HCl give intense cherry red colour indicates the presence of flavonones or orange red colour indicates the presence of flavonols.

(d) The extract is treated with sodium hydroxide, formation of yellow colour indicates the presence of flavones.

(e) The extract is treated with concentrated H₂SO₄, formation of yellow or orange colour indicates flavones.

2.3.7 Test for steroids

(a) Libermann-Burchard test: 1 gm of the test substance was dissolved in a few drops of chloroform, 3 ml of acetic anhydride, 3 ml of glacial acetic acid were added, warmed and cooled under the tap and drops of concentrated sulphuric acid were added along the sides of the test tube. Appearance of bluish-green colour shows the presence of sterols.

(b) Salkowski test: Dissolve the extract in chloroform and add equal volume of conc. H₂SO₄. Formation of bluish red to cherry colour in chloroform layer and green fluorescence in the acid layer represents the steroidal components in the tested extract.

2.3.8 Test for triterpenoids

Noller’s test: Dissolve two or three granules or tin metal in 2 ml thionyl chloride solution. Then add 1 ml of the extract into test tube and warm, the formation of pink colour indicates the presence of triterpenoids.

2.4 In vitro antioxidant activity

2.4.1 Total flavonol content

Flavones and flavonols contents were analyzed by the colorimetric method. 9.8 ml of the prepared extract was mixed with a 10% solution of aluminium chloride (200 μl). After 30 min, absorption was measured at a 425 nm wavelength. The amount was calculated using quercetin calibration curve. The results were expressed as the quercetin equivalent (QE) mg per 100 ml of the sample.

2.4.2 Total polyphenol content

Total polyphenol content was determined using colorimetric method. 2.0 ml of the prepared extract was oxidized using Folin-Ciocalteu reagent (400 μl), and sodium carbonate solution (75 g/l) was then added to the reaction mixture to reach a 10.0 ml volume. After 2 h, the suspension was centrifuged for 10 min at 5000 rpm, and absorption was measured at a 760 nm wavelength. The amount was calculated using the gallic acid calibration curve. The results were expressed as gallic acid equivalent (GAE) mg per 100 ml of the sample.

2.4.3 Hydrogen-donating activity

This assay was used in many studies for testing antioxidant activity. 2,2-diphenyl-1-picryl-hydrazil stable radical (DPPH) evidently offers a convenient and accurate method for titrating the oxidizable groups of natural and synthetic antioxidants. This assay was based on the reduction of a methanolic solution of the colored free radical DPPH by free radical scavenger. The degradation of DPPH was evaluated by comparison with a control sample without hydrogen-donating compounds. The decrease in absorbance of DPPH at its absorbance maximum of 517 nm was proportional to the concentration of free radical scavenger added to DPPH reagent solution. Lower absorbance of reaction mixture indicated higher antioxidant activity. In this study, methanolic solution of DPPH (100 mM, 2.95 ml), 0.05 ml of extracts dissolved in methanol was added at different concentrations (50-250 μg/ml). Reaction mixture was shaken and after 30 min at room temperature, the absorbance values were measured at 517 nm and converted into percentage of antioxidant activity (% AA). Ascorbic acid was used as standard. The degree of discoloration indicates the scavenging efficacy of the extract, was calculated by the following equation.

\[ \% \text{AA} = 100 - \left( \frac{\text{Abs blank} - \text{Abs sample}}{\text{AbsDPPH}} \right) \times 100. \]
2.4.4 Superoxide scavenging activity

Superoxide scavenging (SOD) was carried out by using alkaline Dimethyl sulfoxide (DMSO). Solid potassium superoxide was allowed to stand in contact with dry DMSO for at least 24 h and the solution was filtered immediately before use. Filtrate (200 ml) was added to 2.8ml of an aqueous solution containing nitrobluetetrazolium (56 mM), EDTA (10 mM) and potassium phosphate buffer (10 mM, pH 7.4). Sample extract (1 ml) at various concentrations (50-250 μg/ml) in water was added and the absorbance was recorded at 560 nm against a control in which pure DMSO has been added instead of alkaline DMSO22-24.

3 Results

3.1 Phytochemical screening of extract

The phytochemical screening of Psoralea corylifolia seeds, powder of ethanol extracts demonstrated the presence of alkaloids, polyphenol, tannins, flavonoids and glycoside (Table1). The presence of these phytochemical components may be responsible for the various pharmacological activity of the plant leaves extract.

3.2 In vitro antioxidant activity

3.2.1 Total flavonol content of extract

The concentration of flavonoids in ethanol extract of Psoralea corylifolia seeds was determined spectrophotometrically using aluminum chloride. The content of flavonoids was expressed in terms of quercetin equivalents. The content of flavonoids identified in the tested extracts is shown in table 2. The concentrations of flavonoids in ethanol extract of Psoralea corylifolia seeds, was 60.63 QE mg/gm.

3.2.2 Total polyphenol content of extract

The ethanol extract of Psoralea corylifolia was evaluated for investigation of the total phenolic content concentrations in extracts. The total phenolic content of ethanol extract of Psoralea corylifolia was found to be 74.35 GAE mg/gm (Table 2).

3.2.3 Hydrogen-donating activity of extract

2,2-Diphenyl-1-picrylhydrazyl radical is a stable organic free radical with an absorption band at 517 nm. It loses this absorption when it accepts an electron or a free radical species, resulting in a visually noticeable discoloration from purple to yellow. Ethanol extract of Psoralea corylifolia seeds, strongly scavenged DPPH radical with the IC50 being 166.61 μg/ml (Table 3 & Fig 1). The scavenging was found to dose dependent.

3.2.4. Superoxide scavenging activity of extract

As it is a reactive oxygen species, superoxide has some damaging properties that can be imposed to the cells and DNA and subsequently invites various diseases. Thus, a proposal has been established to gauge the comparative interceptive ability of the antioxidant extracts to scavenge the superoxide radical. Table 3 demonstrated the changes in the activity of SOD upon treatment with the extracts. The ethanol extract of Spilanthes acmella scavenged superoxide radical with the IC50 values of 177.69 μg/ml (Table 4 & Fig 2).

4 Discussions

Preliminary phytochemical screening showed the presence of alkaloids, polyphenol, flavonoids Triterpenes and Steroids in ethanol extract of *Psoralea corylifolia* seeds. It was supported by earlier reports for the presences of phenols and flavonoids in the *Psoralea corylifolia* seeds. Flavonoids and phenols exhibit a wide range of biological activities, one of which is they have the properties of antioxidant activity. Being plant secondary metabolites, the phenolics or polyphenols are very important judging from the virtue of their antioxidant activities by chelating redox-active metal ions, inactivating lipid free radical chains, and avoiding the hydro peroxide conversions into reactive oxyradicals. The ethanol extract of *Psoralea corylifolia* seeds, illustrated the highest total flavonol and polyphenol content. The rich-flavonoid plants could manifest themselves as good sources of antioxidants that would assist in the enhancement of the overall antioxidant capacity of an organism and protection against lipid peroxidation. The total flavonoid content results were entirely synchronous with those of the total phenolic. It was successfully shown that samples with high level of phenolic content also contain flavonoids in great amount. The rich-flavonoid plants could be a good antioxidant source that would help increase the overall antioxidant capacity of an organism and guard it against lipid peroxidation. The ethanol extract of *Psoralea corylifolia* seeds, illustrated the highest total flavonol and polyphenol content. The rich-flavonoid plants could manifest themselves as good sources of antioxidants that would assist in the enhancement of the overall antioxidant capacity of an organism and protection against lipid peroxidation. It was successfully shown that samples with high level of phenolic content also contain flavonoids in great amount. The rich-flavonoid plants could be a good antioxidant source that would help increase the overall antioxidant capacity of an organism and guard it against lipid peroxidation.

5 Conclusion

The findings of study indicates that *Psoralea corylifolia* seed extract contains large amounts of phenolic and flavonoid compounds and exhibits high antioxidant and free radical scavenging activities. The *in vitro* assays of antioxidant exhibit *Psoralea corylifolia* seed extract is a significant source of natural antioxidant, which might be helpful in preventing the progress of various oxidative stresses. Further studies are in progress for the isolation of active constituents responsible for antioxidant activity.
